

**6-16 EXPOSED SLOPES TO BE LESS THAN THE CRITICAL ANGLE OF REPOSE - EXPOSED AREAS TO BE RE-VEGETATED – EXCEPTION.**

No cut or fill slope that is created as a part of the constructing of any dwelling or other structure or any street, road, driveway, railroad, water, gas or electric transmission line, or similar travel or access way, whether publicly or privately owned, shall exceed the critical angle of repose except by special permission of the Countywide Planning Commission. Such permission shall not be given unless measures designed and certified by a licensed professional engineer are in place. Developers of any such project shall be responsible for re-establishing vegetative cover and of constructing any necessary erosion prevention works required as a result of the construction. Where terrain leading to the placement site of a transmission tower or similar structure will not permit the installation of such structure without the slopes of construction travel ways exceeding the critical angle of repose the County may require the use of air transport or other methods in lieu of such construction travel ways.
